

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

### AGRICULTURAL REPORT.

From August 20th, to September 20th, 1814.

About the latter end of last month a change took place in the weather, which afforded a prospect of getting the grain cut down and secured in good order, and during the continuance of it, much harvest work was done in all the early districts, but in the more backward parts of the country there is still a great part of the grain to cut, and very little brought in. In the former, the crops appear to be pretty good, but in the latter, they are, in a general way, thin and short. If the wet weather should again set in, the late corn may be expected to suffer considerably.

It is perhaps rather too early to be able to ascertain how the crop of flax turns out as to produce. The cold wet season was not favourable for it, and those who saved the seed must have experienced a great deal of difficulty in the process.

The potato crops in most, if not all, the early dry grounds that were planted in time, are likely to be productive, those in the cold and retentive soils, will be but an indifferent crop. Such as were planted in low moory ground, have been in many places nearly destroyed by one or two severe nights frost.
